

HOW DO I REMOVE AIR FROM THE SPA LINES?

ERROR CODES DR, DY OR LF WHEN STARTING THE SPA

To fill your spa, remove the cover and the filter cartridge by turning it counter clockwise. Put your garden hose into the threaded hole where the filter cartridge is located and begin to fill your spa through this opening. If your source of water contains metal, such as iron, we recommend attaching a filter to the garden hose. This will help remove metals from the water and facilitate start up. **Always refer to the detailed procedure in the owner's manual for the quick start up of your spa.**

When filling your spa, air can enter your pump, preventing water from circulating. Error codes such as DR, DY or LF may appear on your keypad. Here is the procedure to follow to solve the problem:

1. Unplug the spa;
2. Open the spa panel where the pump is located (on most of our models, this is the panel located in front of the spa, under the keypad);
3. Unscrew the white ring on the pump (see picture);
4. Tighten the ring when water starts to come out, which means there is no more air in the lines;
5. Plug and start the spa.
The PR code should appear on the keypad.
